

Framed folding glass - Silhouette / Shadow

Opening the first panel

Release the first panel by gently pushing the frame of the adjacent panel (1) away from your first panel (2) this will allow the first panel to turn inwards

Opening the remaining panels

The remaining panels will then slide to the side and fold back against the wall

Securing the open panels

Once the required panels are against the wall a slotted parking strap will secure the panels in position

Closing the opened panels

Release the panels and one by one, turn inwards and slide them back to their original position

Guide Arm

When opening the second panel, the wheel block on top of the glass has to engage into the guide arm to force the second panel into the hinge

Ventilation

A ventilation stay is positioned on the sill of the first panel. This can secure the panel in a semi-open (10cm) position. The rubber stopper on the stay must be pushed up into the frame.
